Debugging has changed how we think about software development. It's time to change how we think about debugging too. Whether it's a bug you've fixed, a new idea you've added, or a code snippet you've written, debugging is often the final step of programming. Debugging is the process of finding, diagnosing, and fixing problems. Some users don't like debugging and despise it; others hate it but can't live without it. And yet others love it. That love can be for the challenge of it, the feeling of accomplishment they get at the end, the insight it offers, or the precision it provides, among others. When it comes to the act of debugging, software developers are no different. They try to understand the cause of a problem, either by themselves, a teammate, or through teamwork; they attempt to find it, think about possible solutions, and then attempt to fix it. The problem with this approach is that it doesn't always work. A single developer might debug a whole program in isolation. But when it comes to a team, their individual styles can influence the process. Each developer will be slightly different and will think differently. So how does debugging work on a team? And how should it be done so as to help developers quickly find problems and track them down? Java is used in most enterprise environments and comes with a set of utilities that developers can use to help them debug their applications. They can use debuggers and also use software libraries to help debug their code. The problem is that with Java, it's up to the developer to install, maintain, and use them. So if you're a developer who works in Java, you need to be able to: Know how to use and configure it
