The game based on The Elder Scrolls, allowing for vast fields and dungeons with diverse details, and with an emphasis on role-playing and action elements. You start as a warrior and develop your character by combining weapons, armor, and magic, giving you a sense of inner strength as you rise to become an Elden Lord.

-- * "Hudson, is it snowing already?" * "Winter has come earlier this year." * "I hope it snows a lot this year…" * "I really want it to snow this year…" * "Does it snow in the Lands Between?"

-- * We hope you will enjoy the game. * Thank you and have a nice

day. Two women have been charged with money laundering after police seized an estimated $1 million of alleged drug money in a search on a Brampton farm. The search was executed by Peel Regional Police and Canadian Border Services Agency officers on April 30. The money was seized from a large, barn-style building on a Brampton property, police said. Officers were provided with a search warrant in late March. An investigation was launched. Charges have since been laid against a 31-year-old Brampton woman and a 28-year-old Mississauga woman. Both women have been charged with possession of proceeds of crime, laundering an amount of more than $5,000 and failing to comply with a condition of an undertaking. The accused face more than a year in jail, if convicted.Q: Mapping to a field in mongo when the field name is different from the document Let's say I have a model like this : class Parent(Document): name = StringField() class Child(Document): father = ReferenceField(Parent, _id="_id") name = StringField() I have a list of Parents (100's of them) and I'd like to store the list of their children in another collection, that has been created to have the same fields as the document. How can I do this? I can think of two ways: Create a child field in each of the

documents that stores the list of children in a field with the name of the parent ("parent_children") and then map the list of children from the parent
