Researchers in Scotland have renewed hope that Scotland's biggest monster -- the Loch Ness Monster -- may be alive and well. "There is a good scientific argument that the Loch Ness monster exists," Robert Johnstone, a senior research fellow at the University of St Andrews, recently told New Scientist magazine. "If we can find the right kind of evidence, we can be pretty certain that Nessie is there." In 2004, a team of researchers led by Robert Rines looked at the kinematics of a 1993 sighting and concluded that a chunk of moving water, known as a hydraulic jump, could explain away much of the conflicting reports. In 2009, they conducted a video experiment and concluded that a consistent monster could be viewed, although the size of the creature was not able to be discerned. A new survey being conducted at the same time as the Rines research is hoping to find a more definitive answer. "The computer images that we are going to be accumulating at the end of this study will be some of the very highest resolution images ever taken of the Loch," said team member Joe McGrady, who is also a professor of mathematics and computer science at the University of Aberdeen. McGrady said that the research team had already collected about 1.6 million photographs, and the survey will be conducted between Aug. 8 and Dec. 31. Researchers plan to
