Get it now free and safe. Visit WPC SIGN PRO.Q: How does the Law of Demeter work for interdependent classes? I would like to use the Law of Demeter in a particular situation, and in order to do so, I need to understand how it operates within classes. I understand that I should only call a class's methods directly if they are available from the inside the class. Say I have a class that is responsible for managing errors. It has a method called addError, that takes two arguments, errorMessage and methodName, and should throw a particular exception when errorMessage is "This error should never occur." If the client code will be calling this class directly and getting an exception, is it good practice to add a wrapper method to the class that returns a type of the original class, adding errorMessage as a parameter to this wrapper method? It seems like this requires that I (and other classes using this method) know the method's type, or perhaps make it abstract. How does this work in the presence of other methods that are available from the inside the class? A: Interdependent methods is a good point in your question. This is how I use it: public class WrapperClass { public void doSomething(WrapperClass parent) { doSomethingElse(parent, this); } } public abstract class Parent { public abstract void doSomething(WrapperClass parent); } public class Child extends Parent { public void doSomething(WrapperClass parent) { // Use parent.doSomethingElse() } } If you need to encapsulate the dependency on the class that the method belongs to, you need to create an interface, but this is not part of the Law of Demeter. As if the Tims weren't awesome enough, they are also offering a whopping 3% Back to School Savings for Summer 2015! Grit, Preparedness, and Optimism The Tims will be offering 3% Back-
