In Autodesk Inventor, Inventor specific or AutoLISP can be used to create both plug-ins (in the same manner as AutoCAD Cracked Version, or as additional components to an existing AutoCAD installation) as well as AutoLISP "script". In Autodesk Navisworks, the Navisworks specific APIs, Navisworks API and .NET are used. Graphics library Graphic Objects and layer management In AutoCAD, objects such as lines and arcs can be "grouped" (layers are a similar concept), and it is possible to create layers with complex animation; there are numerous options for animation, and animation is sometimes used in presentations. Parameters Each feature in AutoCAD can be assigned a number of parameters that control the way the feature is drawn. The range of available parameters is wide, and the table of parameter values is the most heavily cited feature of AutoCAD. On screen, the parameters are used to control specific drawing options. In the drawing preferences, they are used to control default settings. Most often, the values of the drawing parameters are used as defaults, for example when a new drawing is opened. It is possible to select the preferences to show or hide groups of parameters; this can be useful when developing applications as it makes it easier to find appropriate settings for different drawing modes and different sizes. Various other ways exist of grouping parameters. A user can create a "parameter group" that is named to provide an intuitive way of browsing through the grouped parameters. A set of parameters can be grouped within a single "default parameter group", allowing easy access to the default values. Groups of groups can be created, and the groups can be moved to "highlighted parameter groups" to make them easier to select. A graphical parameter editor can be used to interactively edit the values of the parameters. Updates to features Many features of AutoCAD are available in multiple versions. For example, "x,y" control points are available in a large number of versions. Different versions can be combined to provide specific functionality. If new functionality is not available in an older version, it is possible to update the existing feature to the most current version. Desktop and mobile applications There are two primary AutoCAD desktop applications available: a Microsoft Windows-based application, and a Mac OS X-based application. An additional mobile application is also available af5dca3d97

I tried following two approaches: First approach: I then tried doing the following in the XAML: but this sets all the height of the ListBoxItem's to match that of the entire ItemsPanel (including the horizontal margin) despite the height of the contained text. I also tried manually setting the Height of the ListBoxItem in code with no luck. Second approach: I then tried doing the following in the XAML:
