there are a lot of code and data not shown in this document that are not used in the program, but i have not been able to find a quick summary of all the code. for example, there is some code to calculate bmi based on height and weight and that is not covered here. in the following code, we use a technique called parameter substitution to quickly change the bmi calculation from the current calculation to the alt calculation. this code is in the calculateage procedure. pyside is based on qt v5, so its api is somewhat different from the api of pyqt. however, the same code can be written in both pyqt and pyside, so you can use either one. pyside is python 2.7 based, while pyqt6 is python 3.6 based. to port pyqt code to pyside, youll need to add a few imports and change the indentation, but you can do it with no difficulty. if you want to learn more about the differences between pyqt and pyside, you can check out pyqt5 vs pyside5. to run the app, you need python 3.6.1 or later. in addition, you need pyside or pyqt, depending on which you used to develop the app. you also need the qt open source libraries, including the qt libraries, the qt designer, and the qt creator. youll need a qt-enabled version of eclipse, the eclipse ide. finally, you need to create a qt-enabled pyside project. if you create a new project with the create your own app option, then all the code, settings, and preferences for the application will be created, and will be generated into a single file, myapp.py. with this code, you can run the application in any qt-enabled ide, and you can create a standalone executable file, ready for deployment.

Age Calculator System App Source Code
